

WHAT ARE YOU PROVING?

Proof Statement

I build practical open-source AI/ML tools by identifying real limitations in existing technical approaches and turning those problems into working solutions. With RagBucket, I explored the problem that RAG systems are not easily portable like traditional ML or deep learning model artifacts, and built a practical approach around portable retrieval artifacts while understanding its current limitations with local FAISS-based retrieval. With LazyTune, I explored the trade-off between the exhaustive but expensive nature of GridSearchCV and the faster but less consistent nature of randomized search, and built a two-stage hyperparameter optimization approach based on pruning and full training. My portfolio is primarily for small startup teams looking for practical open-source solutions and engineers who value problem-driven technical work. The one action I want them to take is to **view my GitHub and examine the projects I have built.**

Why This Portfolio Needs to Exist

My CV or LinkedIn can list RAG, machine learning, Python, and other technical skills, but they cannot show how I identify a real problem, study existing approaches, understand trade-offs and limitations, and turn my reasoning into a working open-source tool.
